MIDDLETON INSTRUMENTS

DIV. OF MEDOS COMPANY PTY. LTD.

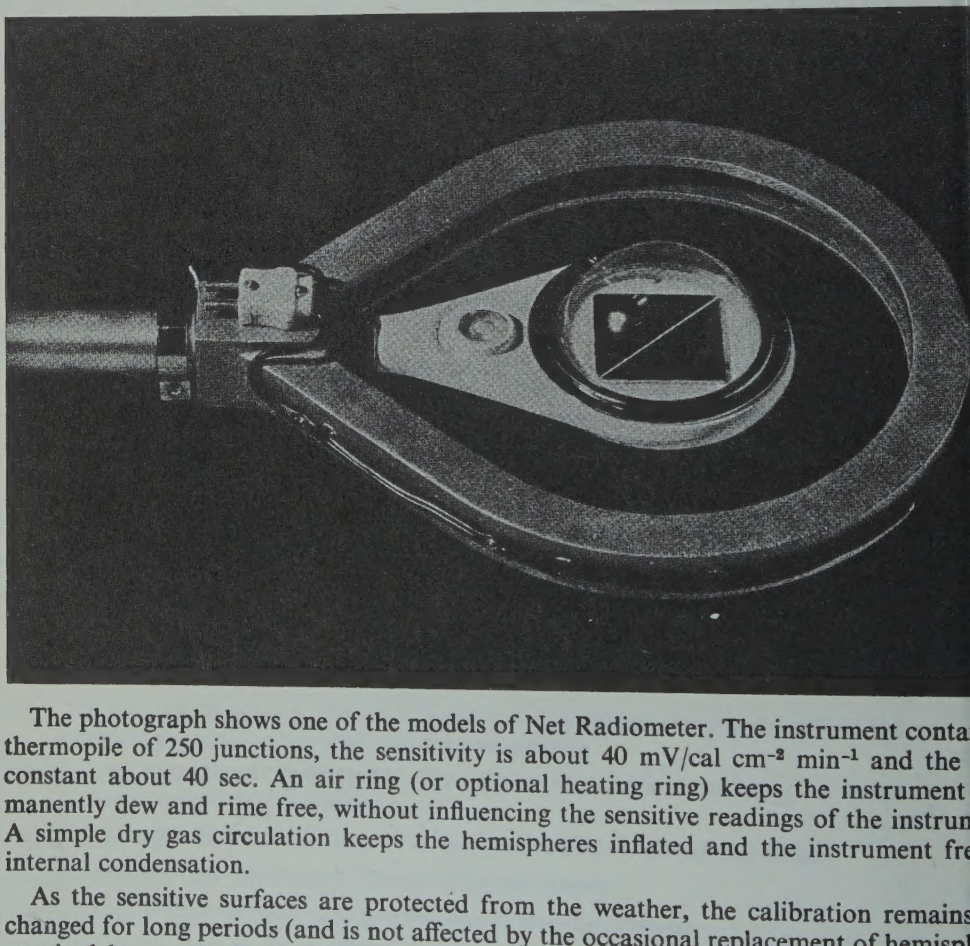
Precision Instrument Makers

75-79 Crockford Street, Port Melbourne, Vic. 3207, Austral

Meteorological Stations, Research Organizations, Universities, Agricultural and W Authorities are invited to direct their enquiries for instruments measuring solar radia to us.

Net Radiometers, Soil Heat Flux Plates, Solari-Albemeters, Solarimeters, Albedom

We are offering three models of Net Radiometers manufactured under licence, Divi of Meteorological Physics, C.S.I.R.O. Aspendale, featuring, in particular, high sensit and stability, absolutely weather proof and supplied with calibration certificate by C.S.I.



The photograph shows one of the models of Net Radiometer. The instrument conta thermopile of 250 junctions, the sensitivity is about 40 mV/cal cm^{-2} min^{-1} and the constant about 40 sec. An air ring (or optional heating ring) keeps the instrument manently dew and rime free, without influencing the sensitive readings of the instrun A simple dry gas circulation keeps the hemispheres inflated and the instrument fr internal condensation.

As the sensitive surfaces are protected from the weather, the calibration remains changed for long periods (and is not affected by the occasional replacement of hemisp required by weathering or damage). The short and long-wave sensitivities are equa by means of diagonal strips of selectively reflecting paint. Instruments of this type already seen extended service both in Australia and overseas, including Antarctica.

Because of their high sensitivity and stability two of these instruments permit measurement of radiative flux divergence in the lowest few metres of the atmosphere.

Adaptors for conversion into an effective pyranometer (total hemispherical radion or a short-wave balance meter, also a long-wave calibration enclosure, are availab accessories.

In addition, a miniaturized version of the instrument is available for biological The element is 1 cm in diameter, with a sensitivity of about 3 mV/cal cm^{-2} min^{-1}.
